WEEK-01 Name: ARAVIND RAJESH

Question 1 WEEK-01-01 Correct Marked out of 3.00

Reg No: 240701046

Flag question **Objective**

This is a simple challenge to help you practice printing to stdout.

Input Format You do not need to read any input in this challenge. **Output Format**

Print *Hello, World!* to stdout.

We're starting out by printing the most famous computing phrase of all time! In the editor below, use either printf or cout to print the string Hello, World! to stdout.

Hello, World! **Answer:** (penalty regime: 0 %) #include<stdio.h> 2 v int main(){

printf("Hello, World!"); 3 return 0; 4 } 5

Expected Got Hello, World! Hello, World! Passed all tests! <

Question 2 Correct Marked out of 5.00 Flag question

Objective

This challenge will help you to learn how to take a character, a string and a sentence as input in C.

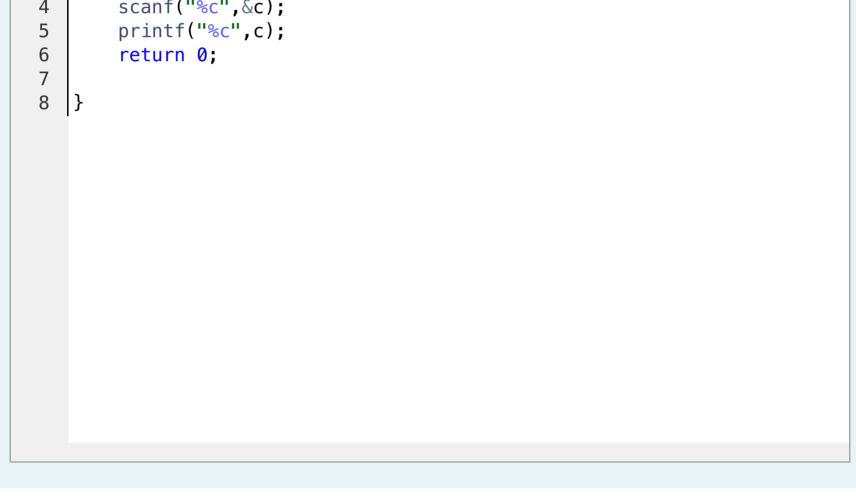

To take a single character ch as input, you can use scanf("%c", &ch); and printf("%c", ch) writes a character specified by the argument char to stdout: char ch;

scanf("%c", &ch); printf("%c", ch);

This piece of code prints the character *ch*. Task You have to print the character, **ch**.

Input Format Take a character, *ch* as input. **Output Format** Print the character, *ch*.

Answer: (penalty regime: 0 %) #include<stdio.h> 2 v int main(){ 3 char c; scanf("%c",&c); 4 printf("%c",c); 5 return 0; 7

Input Expected

C

Question 3

Marked out of 7.00

output their sum:

1.

2.

3.

Constraints

Sample Input

6.0 2.0

Explanation

1

Correct

Passed all tests! <

Got

C

argument, then in the format string we have to

Flag question **Objective** The fundamental data types in c are int, float and char. Today, we're discussing int and float data types.

The printf() function prints the given statement to the console. The syntax is printf("format

The scanf() function reads the input data from the console. The syntax is scanf("format

string",argument_list);. For ex: The scanf("%d",&number) statement reads integer number

Your task is to take two numbers of int data type, two numbers of float data type as input and

Read 2 lines of input from stdin (according to the sequence given in the 'Input Format'

string", argument_list);. In the function, if we are using an integer, character, string or float as

from the console and stores the given value in variable *number*. To input two integers separated by a space on a single line, the command is scanf("%d %d", &n, &m), where \mathbf{n} and \mathbf{m} are the two integers. Task

write %d (integer), %c (character), %s (string), %f (float) respectively.

Print the sum and difference of two float variable rounded to one decimal place on a new line. **Input Format**

Print the sum and difference of two int variable on a new line.

Declare 4 variables: two of type int and two of type float.

Use the + and - operator to perform the following operations:

section below) and initialize your 4 variables.

The first line contains two integers.

1 ≤ integer variables ≤ 10⁴

1 ≤ float variables ≤ 10⁴

The second line contains two floating point numbers.

Output Format Print the sum and difference of both integers separated by a space on the first line, and the sum and difference of both float (scaled to 1 decimal place) separated by a space on the second line.

10 4 4.0 2.0 **Sample Output** 14 6

When we sum the floating-point numbers 4.0 and 2.0, we get 6.0. When we subtract the second number 2.0 from the first number 4.0, we get 2.0 as their difference. **Answer:** (penalty regime: 0 %)

When we sum the integers 10 and 4, we get the integer 14. When we subtract the second

number 4 from the first number 10, we get 6 as their difference.

#include<stdio.h>

2 √ int main(){ int a,b; 3 float c,d; 4 scanf("%d %d",&a,&b); 5 scanf("%f %f",&c,&d); 6 printf("%d %d\n",a+b,a-b); 7 printf("%.1f %.1f",c+d,c-d); 8 return 0; 9 10

```
WEEK-01-02
Question 1
Correct
Marked out of 3.00
Flag question
 Write a program to input a name (as a single character) and marks of three tests as m1, m2,
 and m3 of a student considering all the three marks have been given in integer format.
 Now, you need to calculate the average of the given marks and print it along with the name
 as mentioned in the output format section.
 Input format:
 Line 1: Name(Single character)
 Line 2: Marks scored in the 3 tests separated by single space.
 Output format:
 First line of output prints the name of the student.
 Second line of the output prints the average mark.
 Constraints
```

All the test marks are in integers and hence calculate the average in integer as well. That is, you need to print the integer part of the average only and neglect the decimal part.

Marks for each student lie in the range 0 to 100 (both inclusive)

Sample Input 1: Α

346

Sample Output 1: Α 4

738 Sample Output 2: Τ 6

1

3

4

Sample Input 2:

Т

float f1; 5 scanf("%c %d %d %d",&ch,&m1,&m2,&m3); 6 7 m4=m1+m2+m3;8 f1=m4/3;printf("%c\n",ch); 9 printf("%.f",f1); 10 return 0; 11 12 }

Input

3 4 6

Τ

Answer: (penalty regime: 0 %)

2 v int main(){

#include<stdio.h>

char ch;

int m1, m2, m3, m4;

Expected Got

Α

Τ

Α

4

Τ

7 3 8 6 R R R 0 100 99 66 66 Passed all tests! < Question 2 Correct Marked out of 5.00 Flag question Some C data types, their format specifiers, and their most common bit widths are as follows: *Int ("%d"):* 32 Bit integer

Long ("%ld"): 64 bit integer

Char ("%c"): Character type

Float ("%f"): 32 bit real value

Double ("%lf"): 64 bit real value

To print a data type, use the following syntax:

For example, to print a *character* followed by a *double*:

printf("`format_specifier`", val)

For the moment, we can ignore the spacing between format specifiers.

Note: You can also use cin and cout instead of scanf and printf; however, if you are taking a

million numbers as input and printing a million lines, it is faster to use scanf and printf.

Input consists of the following space-separated values: int, long, char, float, and double,

To read a data type, use the following syntax: scanf("`format_specifier`", &val) For example, to read a *character* followed by a *double*: char ch; double d; scanf("%c %lf", &ch, &d);

Printing

char ch = 'd';

Input Format

respectively.

double d = 234.432;

printf("%c %lf", ch, d);

Reading

Output Format Print each element on a new line in the same order it was received as input. Note that the floating point value should be correct up to 3 decimal places and the double to 9 decimal places. **Sample Input**

> int a; long l; char ch; float f; double d; scanf("%d %ld %c %f %lf",&a,&l,&ch,&f,&d); printf("%d\n%ld\n%c\n%.3f\n%.9lf",a,l,ch,f,d); return 0;
